The printing given to the transparency should be at least three times that required for a print to be viewed by reflected light--under-exposure being the most general mistake. Tissue not too newly sensitised, full printing and prolonged development in hot water are the conditions most favorable to successful results. The exposed tissue is mounted in cold water on the coated glass, squeegeed, allowed to remain at least a quarter of an hour, then developed in hot water as any other carbon print, rinsed in cold water and soaked in 5 per cent, alum solution for a while to get rid of the bichromate, as although there is no paper base to show the stain, the gelatine picture holds enough bichromate to deteriorate the color of the pigment employed if left in the film; a final rinse, and the transparency, when dry,...
